

Unified Workday Product Brief

Goal

Make applying to multiple companies through Workday less repetitive by giving users one centralized profile that can intelligently adapt their information to each company's application while keeping them in control of what gets submitted.

1. Why AI? Product + Flow Chosen

- **Product:** Workday
- **Flow:** Applying to multiple companies through the Workday portal
- **Reasoning:** AI is needed to intelligently map a user's saved profile across different company forms, reducing repetitive work and errors.

2. User & Moment

- User has already applied to a job at Company A, creating a Workday account and filling out their profile.
- When the same user tries to apply to Company B, they are forced to create a new account, even though their info already exists.
- **Moment of friction:** User wants to apply quickly and efficiently but has to re-enter the same information multiple times.

3. What's Broken (Evidence / Reasoning)

- Users must create a new Workday account for every company, which is frustrating and demotivating.
- Leads to redundancy, wasted time, and a poor experience.
- **Example:** Entering the same resume, graduation date, and contact info multiple times.

4. Your Rebuilt AI Experience

New Flow:

- **First Application (e.g., NVIDIA):** User creates one unified Workday account and fills out their profile once.
- **Next Applications (e.g., Salesforce):** User clicks "Apply with Workday", signs in → AI Agent activates.

AI Agent Workflow:

- Reads saved Workday profile data
- Examines the new company's form (different companies ask different questions)
- Maps fields intelligently with confidence scoring
- Auto-fills high-confidence fields (name, email, phone)
- Flags low-confidence fields for human review
- Adjusts formats to match company requirements (e.g., "Expected Graduation" → "Graduation Date")
- **Human Review:** User confirms or edits flagged fields, then submits.
- **Dashboard:** User can see all applications across all companies in one place, eliminating the need for multiple accounts.

5. Where AI Fits (Specific Model / Agent Role)

- **Architecture:** Agentic Workflow with GPT-4 (or similar LLM)
- **Agent Role:** Smart Field Mapper & Schema Adapter

Schema Analysis:

- Reads each company's form structure and requirements
- Recognizes differences in field names (e.g., Salesforce: "Graduation Date," NVIDIA: "Expected Graduation")

Confidence-Based Decisions:

- Assigns confidence scores to each field mapping
- Auto-fills high-confidence fields
- Flags uncertain fields for user review

- **Example:** 95% confident "full_name" → "legal_name," 40% confident "LinkedIn" → "professional_profile"

Why we used an Agentic LLM instead of Hard-Coded Rules / Simple Autofill:

- **Rule-based autofill breaks easily:** Hard-coded rules rely on exact field matches. Because every company's Workday form uses different labels and custom questions, rigid rules fail on unexpected inputs.
- **Semantic reasoning & adaptability:** A GPT-based agent understands the intent behind different phrasing (e.g., mapping "Degree Completion" to "Expected Graduation") without needing pre-programmed rules for every edge case.
- **Intelligent human-in-the-loop control:** Unlike blind autofill, an agentic workflow evaluates its own confidence scores for each field mapping and flags low-confidence fields for manual human review before submission.

6. One Tradeoff Accepted

- Old Workday system was per-company, so organizing applications was straightforward.
- New system compiles all applications in one place, increasing efficiency but introducing potential clutter.

Possible Solutions:

- **Search filters:** Search by company, role, name, or keyword
- **Company sections:** Group applications by company; users can expand to see only that company's apps

7. A Possible Risk

- AI could mis-map a critical field and autofill incorrect info.
- **Examples:**
 - "Expected Graduation: May 2025" → "Years of Experience"
 - Could send wrong information to employers.
- **Solution:** Human-in-the-loop review for all flagged fields.

8. Metrics and Next Steps

Success Metrics:

- Reduced application completion time vs old Workday flow (North Star metric)
- Increased number of users applying to multiple companies using Workday
- Error rate and user satisfaction (low mistakes, positive feedback)

Next Steps:

- Add filters or sections by company if dashboard navigation is confusing.
- Collect survey feedback on usability and flagged fields
- Iterate confidence scoring to improve which fields are autofilled vs flagged

Cost / latency / trust considerations:

- AI calls can be slightly slower than a simple hard-coded autofill.
- Using a pre-trained LLM has a cost per API call, but it's worth it for the adaptability.
- Human-in-the-loop review keeps the user in control and ensures mistakes are caught.
